

Securd — Go-To-Market & Launch Strategy

XRP Ledger Mainnet

Securd Labs | Business Development Team

26 May 2026

Executive Summary

Securd is a money market built natively for the XRP Ledger. Users supply and borrow assets directly from their XRPL wallet — no new accounts, no chain switching, no technical complexity. The protocol accepts XRP, bridged major assets, Midas liquid XRP, and for the first time on the XRP Ledger, native AMM LP tokens as collateral.

The XRP Ledger's DeFi ecosystem is in its earliest phase. The total addressable market includes over 5.8 million XRPL accounts, \$8M in AMM liquidity, \$5.4M in mXRP on the protocol layer, and a fast-growing institutional presence anchored by Ripple's RLUSD stablecoin. No lending protocol has yet fully captured this opportunity with the depth of asset coverage, security architecture, and user experience that Securd offers.

Launch objective: \$2M TVL within 30 days, \$5M within 90 days, \$10M within 6 months.

1. Protocol Architecture — What Users Experience

The Securd user journey lives entirely on the **XRP Ledger mainnet**:

1. User holds XRP, USDC, WETH, mXRP, or LP tokens in their XRPL wallet
2. User opens Securd from their Xaman or Crossmark wallet
3. User selects an asset to supply or a market to borrow from
4. Transaction signs on XRP Ledger — one tap, no EVM, no MetaMask
5. Axelar bridges the asset to the Securd protocol layer transparently
6. Borrowed assets are delivered to the user's XRPL Ledger address

The protocol's internal architecture runs on XRPL EVM, but this is entirely invisible to the user. Securd is, from every user's perspective, an XRP Ledger protocol.

This design is a fundamental product advantage: **Securd speaks XRPL natively.**

2. Assets Available at Launch

Confirmed Markets — Day 1

Asset	XRPL Ledger source	Role
XRP	Native	Collateral + Borrow
USDC	Axelar gateway — <code>rfmS3zqrQrka8wVyhXi fEeyTwe8AMz2Yhw</code>	Collateral + Borrow
USDT	Axelar gateway — <code>rfmS3zqrQrka8wVyhXi fEeyTwe8AMz2Yhw</code>	Collateral + Borrow
WETH	Axelar gateway — <code>rfmS3zqrQrka8wVyhXi fEeyTwe8AMz2Yhw</code>	Collateral + Borrow
WBTC	Axelar gateway — <code>rfmS3zqrQrka8wVyhXi fEeyTwe8AMz2Yhw</code>	Collateral + Borrow
mXRP	Midas + Axelar — 2,384 XRPL holders	Collateral only
XRP/RLUSD LP	XRPL AMM <code>rhWTC2...</code> — Axelar ITS in progress	Collateral only
XRP/USDC LP	XRPL AMM <code>rM7cHVP...</code> — Axelar ITS in progress	Collateral only
XRP/ARMY LP	XRPL AMM <code>rnsRq5a...</code> — Axelar ITS in progress	Collateral only

Monitoring — Bridge Not Yet Confirmed

Asset	Status	Listing condition
RLUSD	⚠ Pending bridge	List when bridging from XRPL Ledger to protocol layer is confirmed

The XRP/RLUSD LP token is available at launch and gives holders indirect exposure to RLUSD pool dynamics. The direct RLUSD lending market will be announced separately once the bridge is confirmed.

3. Total Addressable Market — Who Uses Securd

3.1 XRP Holders — The Core Market

The XRP Ledger has over **5.8 million accounts**, a significant portion of which hold XRP as a long-term investment with no productive use for the capital. These users face a common dilemma: they believe in XRP's long-term value, but they need liquidity today — for personal expenses, for trading opportunities, or for DeFi participation — without wanting to trigger a taxable sale or lose their position.

Securd solves this directly. A holder of 100,000 XRP (\$139,000) can deposit their XRP as collateral and borrow up to \$104,250 in USDC or USDT — instantly, from their Xaman wallet, without selling a single XRP. They retain full exposure to XRP price appreciation, they receive liquid stablecoins, and they can repay whenever they choose.

The addressable base is enormous. Even conservative penetration of 1% of XRPL accounts represents 58,000 potential users. If only 10% of those users maintain an average \$500 borrowing position, this segment alone generates \$29M in borrow volume.

Key targeting:

- Long-term XRP holders ("XRP whales") with 10,000+ XRP holdings
- XRP community members who regularly discuss leverage and yield in XRPL Telegram and Discord groups
- Institutional holders who cannot sell XRP (OTC dealers, early investors with vesting)

3.2 RLUSD Holders — The Yield-Seeking Market

RLUSD is Ripple's regulated USD stablecoin, backed 1:1 by USD and US T-Bills. The XRP/RLUSD AMM pool holds \$5.26M in liquidity with \$636K in weekly trading volume. Every RLUSD holder is a potential Securd supplier.

RLUSD held passively earns nothing. Supplied to Securd, RLUSD earns up to **7.2% APY** from borrower interest — paid entirely in stablecoins, with no impermanent loss, no XRP price exposure, and no complex strategies required.

When the RLUSD bridge is confirmed, the RLUSD lending market becomes Securd's highest-value market by TVL potential. The entire \$2.5M RLUSD reserve in the XRP/RLUSD AMM could potentially be deployed into Securd's supply side, generating yield for RLUSD LPs who currently earn only trading fees.

Key targeting:

- XRP/RLUSD LP holders who want yield on their RLUSD beyond just pool fees
- Institutional RLUSD holders (Ripple ecosystem partners, financial institutions holding RLUSD for settlement)
- Retail RLUSD holders seeking on-chain yield without DeFi complexity

3.3 Cross-Chain Liquidity — The Global Capital Pool

Securd is not limited to XRP Ledger assets. Through Axelar's bridge infrastructure, users from any major blockchain can supply liquidity to Securd and earn yield that is often significantly higher than what is available on mature, saturated protocols on their home chains.

Why cross-chain capital flows to Securd:

Early-stage protocols in growing ecosystems offer structurally higher yields than mature protocols on established chains. An Ethereum user earning 2–3% APY on USDC in a saturated market

faces a simple calculation when Securd offers 8-14% APY during its Liquidity Incentive Program. The yield differential is large enough to justify the bridging cost and minor complexity.

The cross-chain flow:

A user on Ethereum can supply 10,000 USDC to Securd in a single Squid Router transaction. They sign one transaction on Ethereum — Squid handles the bridge, the supply, and the accounting. Their USDC earns Securd yield. They withdraw by reversing the same route.

Target cross-chain capital sources:

Source chain	Target asset	Yield differential motivation
Ethereum	USDC, WETH, WBTC	2-3% home yield → 8-14% on Securd (LIP period)
BNB Chain	USDC, USDT	4-5% home yield → 8-14% on Securd
Polygon	USDC	3-4% home yield → 8-14% on Securd
Arbitrum	WETH, USDC	3-5% home yield → 8% on Securd
Avalanche	USDC, USDT	4-5% home yield → 8-14% on Securd

Cross-chain marketing message:

"XRPL EVM is early. Early means higher yields. Bridge your USDC to Securd via Squid Router in one transaction and earn 8.7% APY — significantly above what mature markets offer."

4. Advanced Strategies — Leverage and Delta-Neutral Using LP Tokens

One of Securd's most powerful and genuinely novel features is the acceptance of XRP/RLUSD and XRP/USDC LP tokens as collateral. This unlocks two advanced strategies that are impossible without LP collateral: **recursive leverage** and **delta-neutral yield farming**.

4.1 Recursive Leverage on XRP

A user who is bullish on XRP can use Securd to build a leveraged XRP position while simultaneously earning LP trading fees. This strategy uses the XRP/RLUSD pool and Securd's LP collateral market in a compounding loop.

Setup:

The user starts with 10,000 XRP (\$13,900) and an equal amount of RLUSD.

Step 1 — Provide initial liquidity:

Deposit 10,000 XRP + \$13,900 RLUSD into the XRP/RLUSD AMM pool.

Receive: \$27,800 worth of XRP/RLUSD LP tokens.

LP earns: 2.9% APY from pool trading fees.

Step 2 — Deposit LP tokens as collateral on Securd:

Supply the \$27,800 LP position to Securd (CF = 62%).

Maximum borrow capacity: $\$27,800 \times 62\% = \$17,236$.

Step 3 — Borrow and reinvest:

Borrow \$8,000 XRP + \$8,000 RLUSD from Securd.

Add this to the XRP/RLUSD AMM pool → receive \$16,000 more LP tokens.

Deposit new LP tokens on Securd → additional borrow capacity = $\$16,000 \times 62\% = \$9,920$.

Step 4 — Optional additional loop:

Borrow \$4,500 XRP + \$4,500 RLUSD → add to AMM → receive \$9,000 LP tokens.

Deposit → borrow capacity = \$5,580.

Result after 3 loops:

	Initial	After Loop 1	After Loop 2	Total
LP position	\$27,800	\$43,800	\$52,800	~\$55K
Borrow on Securd	\$0	\$16,000	\$25,000	~\$28K
Net equity	\$27,800	\$27,800	\$27,800	\$27,800
Effective XRP leverage	1.0×	1.6×	1.9×	~2.0×
LP fee income on	\$27,800	\$43,800	\$52,800	~\$55K

With \$27,800 of initial capital, the user achieves approximately **2× XRP exposure** while earning LP fees on \$55,000 of LP position — nearly double the LP fee income compared to a non-leveraged position.

Profit condition: Strategy is profitable as long as LP fee APY exceeds Securd borrow rate. At 2.9% LP fees and Securd XRP borrow rate of ~4–5%, the fees partially offset the borrow cost, and the net XRP price appreciation provides the return.

Risk: If XRP price falls, both the collateral value (LP tokens) and the debt (XRP) move against the position. A 20% XRP drop reduces the LP value by ~10% (due to RLUSD cushion from impermanent loss mechanics) while the XRP debt value falls proportionally. The health factor must be monitored carefully.

4.2 Delta-Neutral Yield Farming with LP Collateral

The delta-neutral strategy extracts yield from the XRP/RLUSD pool and the Securd borrow market while eliminating net XRP price exposure. The user earns fees and interest without directional risk.

The problem LP providers face: Providing XRP/RLUSD liquidity creates 50% XRP price exposure. If XRP drops 20%, the LP position loses approximately 10% of its USD value (impermanent loss mechanics provide a partial buffer). The LP provider is involuntarily long XRP.

Securd's solution: Use LP tokens as collateral to borrow XRP and immediately sell it — creating a short position that offsets the LP's long XRP exposure.

Mechanics:

Step 1 — Create the LP position:

Deposit \$10,000 XRP + \$10,000 RLUSD = \$20,000 XRP/RLUSD LP.

XRP exposure in LP: $50\% \times \$20,000 = \$10,000$ long XRP.

Step 2 — Deposit LP on Securd and borrow XRP:

Supply \$20,000 LP as collateral (CF = 62%) → borrow capacity = \$12,400.

Borrow \$10,000 worth of XRP.

Step 3 — Sell the borrowed XRP:

Sell borrowed XRP on the XRP Ledger DEX for RLUSD or USDC.

This creates: **\$10,000 short XRP** position.

Net exposure:

Position	XRP Delta
LP position (50% XRP)	+\$10,000
Borrowed XRP sold	-\$10,000
Net XRP exposure	≈ \$0

Result: The user holds a delta-neutral position with the following income streams:

Source	Annual yield
XRP/RLUSD LP trading fees	2.9% on \$20,000 = \$580/year
USDC/RLUSD earned from selling borrowed XRP	Interest on sold proceeds
Borrow cost	−4.0% on \$10,000 = −\$400/year
Net annual income	~\$180-\$400/year on \$20,000

The net yield is modest in itself — the power of this strategy is that it is **market-neutral**. The user earns steady income regardless of whether XRP goes up or down, with no directional bet. For risk-averse capital allocators (funds, treasury managers, institutional holders), this is the most attractive use case Securd offers.

Optimization: If the Securd XRP borrow rate is low relative to LP fee income, the net yield improves. If RLUSD becomes available as a borrowable asset on Securd (when bridge confirmed), users can borrow RLUSD instead of XRP and use it to buy the RLUSD side of a new LP position — creating a more capital-efficient delta-neutral loop.

4.3 Communication of Advanced Strategies

These strategies are powerful but require clear, step-by-step explanation. Securd's content plan allocates specific resources to advanced strategy education:

- Dedicated "Strategies" page on the Securd documentation site
- 3-part video series: "Advanced Strategies on Securd" (leverage loop, delta-neutral, and LP compounding)
- Weekly "Strategy Spotlight" in the Discord server
- Collaboration with DeFi educators to produce independent tutorials

The target audience for advanced strategies is the top 10% of XRPL DeFi users — power users who understand AMM mechanics and are actively looking for yield optimization. These users also have disproportionate influence on community growth: one power user who demonstrates a strategy publicly can bring in 20–50 followers who attempt to replicate it.

5. Key Success Factors from DeFi Protocol Launches

Before proposing Securd's strategy, it is worth establishing the empirical foundations — what has consistently driven success in money market protocol launches across DeFi.

3.1 Security and Transparency Are Table Stakes

Protocols that published complete security audits, open-source code, and risk parameter documentation before launch consistently built deeper community trust and retained capital longer. Protocols that cut corners on transparency experienced accelerated capital flight at the first sign of stress. **Securd will publish the full security audit, risk parameters, and oracle architecture on Day 1.**

3.2 Liquidity Mining Remains the Most Powerful TVL Catalyst

In every documented DeFi money market launch, the introduction of supplier incentives (token emissions, fee sharing, or bonus APY) accelerated TVL growth by 3–10× compared to equivalent protocols without incentives. The mechanism is self-reinforcing: higher TVL attracts more capital, which increases utilization, which increases rates, which attracts more capital. **Securd's Liquidity Incentive Program (LIP) is the single most important growth lever and must be activated from Day 1.**

3.3 Chain Foundation Backing Compresses Time-to-Liquidity

Protocols launched with committed backing from the underlying chain's foundation or ecosystem fund reached TVL milestones 4–6× faster than those bootstrapping alone. The capital deployment is secondary to the signal — foundation backing validates the protocol to large institutional LPs who otherwise require months of track record. **Securing an XRPL Foundation grant or Ripple ecosystem commitment before launch is the highest-priority business development activity.**

3.4 Protocol Integrations Compound Growth

Money markets that integrated with wallets, DEXs, liquidation bots, and yield aggregators in the first 60 days outperformed standalone protocols on the same chain by over 5× in 6-month TVL. Each integration creates a new user acquisition channel and a new source of on-chain activity. **Xaman integration on Day 1 is not optional — it is the primary user acquisition channel.**

3.5 The First 72 Hours Define Perception

Media attention, community excitement, and institutional LP awareness peak in the first 72 hours after launch. A protocol that starts with \$2M TVL on Day 1 receives disproportionate coverage and LPs relative to one that grows to \$2M over three months. This asymmetry makes the pre-launch seeding and coordination with launch partners the most leveraged activity in the entire strategy. **Every partner announcement, LP commitment, and media placement should be planned to detonate on Day 1.**

3.6 Sticky Incentives Beat Mercenary Capital

Protocols that rewarded sustained use over 90+ days (rather than just the first deposit) retained 60–80% of their TVL through incentive program changes. Protocols that incentivized only the first deposit saw 70–90% of capital leave when the program ended. **Securd's LIP must reward sustained 90-day positions, not first-block depositors.**

6. Go-To-Market Phases

Phase 0 — Foundation (8 Weeks Before Launch)

Objective: Build everything needed for a powerful Day 1. Nothing is public yet.

Technical Readiness Checklist

- [] Security audit complete — report ready to publish Day 1
- [] All oracle contracts deployed, stable for 3+ weeks
- [] All 9 markets seeded with protocol-owned liquidity
- [] Liquidation bot deployed and tested with 100+ simulated positions
- [] Axelar LP token ITS registration confirmed in writing
- [] Xaman dApp submission approved (submit 5 weeks before launch)
- [] End-to-end user flow tested: Xaman wallet → supply XRP → borrow USDC → repay

Business Readiness Checklist

- [] Midas Finance partnership signed — email blast to 2,384 mXRP holders on Day 1
- [] XRPL Foundation grant submitted
- [] Ripple ecosystem fund meeting secured
- [] Circle USDC grant application submitted
- [] 3 institutional LPs committed (\$500K+ total) — private, not announced yet
- [] DefiLlama adapter built and ready to go live Day 1
- [] CoinGecko listing submitted

Community Pre-Build

- [] Discord server created with moderation team in place
 - [] Twitter/X account active (post 3 teasers/week without naming the protocol)
 - [] 50-person alpha tester community recruited from XRPL developer circles
 - [] Closed beta completed — all critical flows tested by real users
-

Phase 1 — Reveal (2 Weeks Before Launch)

Objective: Build anticipation and capture the attention of the XRPL community before competitors can respond.

Week -2: Protocol Reveal

The protocol is named publicly for the first time.

Day of reveal — content cadence:

Time	Content	Channel
09:00 UTC	Brand reveal + website live	Twitter/X
09:30 UTC	"What is Securd" — 12-tweet thread	Twitter/X
10:00 UTC	Midas Finance retweet + "mXRP collateral" announcement	Twitter/X
11:00 UTC	Axelar retweet + "LP tokens bridgeable" announcement	Twitter/X
12:00 UTC	Discord opens to public	Discord
14:00 UTC	Blog post: full protocol explanation with visuals	Blog + Mirror
16:00 UTC	First AMA — founders + Midas team	Twitter Spaces
18:00 UTC	Security audit report published	GitHub + Blog
20:00 UTC	Risk parameters document published	Blog

Key reveal messages:

"Securd brings XRP Ledger users the one financial primitive they've been missing: the ability to borrow against their assets without selling them."

"Your XRP/RLUSD LP tokens are about to earn twice — pool fees plus borrowing power. First time on the XRP Ledger."

Week -1: Education and Anticipation

- Monday: "Three reasons to supply USDC on Securd" — APY comparison vs alternatives
- Tuesday: Video tutorial — "How to borrow USDC against XRP in Xaman (60 seconds)"
- Wednesday: Partner spotlight — Midas Finance + mXRP explained for new users
- Thursday: Partner spotlight — Axelar + LP token bridging explained
- Friday: Launch date confirmed, "First 72 hours" incentive bonus announced
- Weekend: Community AMA — every question answered publicly

Week -1 KPI: 2,000+ Discord members, 5,000+ Twitter followers, 300+ waitlist signups

Phase 2 — Launch (Day 1 to Week 4)

Day 1 — The Launch Moment

Day 1 must feel like an event, not a deployment.

Coordinated launch sequence:

Time	Action	Partner
07:00 UTC	Protocol goes live	Securd
07:05 UTC	"Securd is live on the XRP Ledger" — launch tweet thread	Securd
07:10 UTC	Midas Finance sends email to all 2,384 mXRP holders	Midas
07:30 UTC	Axelar announces LP token ITS registration completion	Axelar
08:00 UTC	Xaman in-app notification to dApp users	Xaman
08:30 UTC	First deposit milestone tweet (track live)	Securd
09:00 UTC	XRPL Foundation welcome tweet	XRPL Foundation
10:00 UTC	Live Discord AMA — founders answering questions	Securd team
12:00 UTC	"First 100 depositors" leaderboard published	Securd
16:00 UTC	Twitter Spaces: "Securd Launch — The XRP Ledger Money Market"	Securd + Midas + Axelar
23:59 UTC	Day 1 recap: TVL, depositors, markets active, any incidents (transparent)	Securd

Day 1 target: \$500K TVL, 50 unique depositors

Liquidity Incentive Program (LIP) — Days 1 to 90

The LIP is the most critical mechanism for TVL growth. Structure:

Tier 1 — First-mover bonus (Days 1-14):

- Suppliers in any market receive 2.5× the base supply APY

- Borrowers pay 0.5× the base borrow APY
- This bonus is a one-time, non-repeatable advantage communicated loudly before launch

Tier 2 — Sustained supplier bonus (Days 15-90):

- Suppliers who maintain a position for 30+ consecutive days receive a loyalty bonus: +1.5% APY
- Suppliers at 60+ days: +2.5% APY
- Suppliers at 90 days: +3.5% APY + "Genesis Supplier" badge (meaningful if governance token is introduced)

This structure rewards the capital that matters — sticky capital that stays through volatility.

Effective APYs during LIP:

Market	Normal Supply APY	LIP Tier 1 (Days 1-14)	LIP Tier 2 at 90 days
XRP	3.2%	8.0%	6.7%
USDC	5.7%	14.3%	9.2%
USDT	5.7%	14.3%	9.2%
WETH	3.4%	8.5%	6.9%
WBTC	3.2%	8.0%	6.7%

Week 1-4 Content Cadence

Daily:

- Protocol metrics tweet: TVL, active borrowers, best supply rates
- One user testimonial or case study (sourced from Discord community)

Weekly:

- "Securd Weekly" — 5-point summary of protocol activity
- One partnership announcement (staggered — do not announce all at once)
- One tutorial video

Month 1 KPI targets:

Metric	Target
Total TVL	\$3M
Unique depositors	400
Unique borrowers	150
XRP market utilization	35-45%
USDC market utilization	60-75%
Protocol revenue	\$8,000
Discord members	3,000
Twitter followers	10,000

Phase 3 — Growth (Month 2-4)

TVL Compounding Through Integrations

The protocol's TVL growth rate accelerates when external protocols integrate with Securd. Each integration creates a new user acquisition funnel.

Priority integrations — Month 2:

1. Liquidation Bot Ecosystem

Deploy open-source liquidation bot documentation and offer a \$5,000 grant to the first 3 teams that run production liquidation bots against Securd. Active liquidation bots increase protocol safety and signal liveness to institutional LPs.

2. Squid Router — Bridge and Supply

One-click flow from any EVM chain: user on Ethereum sends USDC → Squid bridges to XRPL EVM → Securd auto-supplies. This opens Securd to the entire Ethereum and cross-chain DeFi user base.

3. XRPL.to / Bithomp — Live Market Data

Securd APYs and TVL displayed on the primary XRPL analytics sites. Every XRPL Ledger user who checks their AMM data also sees Securd's rates.

4. Yield Aggregator Integration

Any XRPL EVM yield optimizer (present or future) should route stablecoin deposits through Securd's USDC/USDT markets automatically. This creates a passive, scalable TVL funnel.

LP Token Collateral Campaign

The XRP/RLUSD LP pool has over 3 billion LP tokens outstanding. Every holder of these tokens is a potential Securd borrower.

Campaign: "Your LP Earns Twice"

Message: Your XRP/RLUSD LP tokens earn 2.9% APY from pool trading fees. By depositing them as collateral on Securd, you also unlock up to 62% of their value as borrowing capacity — in XRP, USDC, or any Securd market. The LP keeps earning. You get liquidity.

Execution:

- Identify top 100 LP token holders via on-chain data (XRPL Ledger is transparent)
- Direct outreach to each wallet's associated accounts or public social presence
- Targeted Twitter content showing the math: LP fees + borrowing power vs. LP fees alone
- Tutorial: "How to deposit XRP/RLUSD LP as collateral on Securd (Xaman walkthrough)"

Target: 500 LP holders converted to Securd users in Month 2-3 → \$500K+ LP TVL

mXRP Acquisition — Realistic Approach for Month 2

A significant share of existing mXRP holders already have access to another lending protocol in the ecosystem. Securd is entering a market where mXRP liquidity is not unclaimed. The strategy must be realistic.

Target 1 — New mXRP minters (cleanest acquisition):

Every week, new users mint mXRP on Midas Finance. These users have no existing lending protocol relationship. Monitoring new mXRP issuance events on-chain enables outreach to these users within 72 hours of their first mXRP transaction — before a competitor captures them. This is the cleanest, lowest-friction acquisition channel for mXRP users.

Target 2 — Safety-conscious holders:

Users currently borrowing against mXRP at aggressive collateral factors elsewhere carry real liquidation risk. Securd's conservative 60% CF with a hard oracle price cap provides meaningful protection. Content campaign: "Use mXRP as collateral without the liquidation risk of over-leveraging" — educational, no protocol named.

If Midas discussions progress to a formal collaboration:

- Joint tutorial content on using mXRP in Securd
- Midas surfaces Securd in its UX for mXRP holders
- Possible co-announcement

Realistic Month 3 target: 200-400 mXRP users on Securd; \$200K-\$500K mXRP TVL. Not the full mXRP holder base — a conservative slice of new minters and safety-focused holders.

Phase 4 — Scale (Month 5-12)

Milestone	Month	Strategic action
RLUSD market launch	5-6 (bridge confirmed)	Immediate media push; Ripple co-announcement
\$5M TVL	4	Press release to crypto media (Decrypt, The Block)
\$10M TVL	7	Governance forum opened
1,000 active borrowers	7	"1,000 Borrowers" celebration campaign
Governance token design	8	Community input process
SECURD token launch	9-10	Retroactive airdrop to early users + ongoing emissions
New asset listings	10-12	SOLO, XAH, FLR — pending liquidity and oracle confirmation

7. Partnership Strategy

Approach Principles

Three rules govern Securd's partnership strategy:

1. **Mutual value first.** Every partnership must create measurable value for both parties. Securd does not pursue logo partnerships — only partnerships where the partner has a direct commercial interest in Securd's success.
2. **Depth over breadth.** Three deep integrations (Midas, Axelar, Xaman) are worth more than twenty logo placements. Prioritize partners whose users become Securd users.
3. **Sequence for momentum.** Announce partners in a sequence designed to maintain weekly news flow for 6 weeks after launch. Each announcement feeds the next.

Partner Roster and Value Propositions

Midas Finance — Target Strategic Partner

The relationship: Midas issues mXRP, which has \$5.4M on the protocol layer and 2,384 active XRPL Ledger holders. The relationship is naturally complementary: Midas grows mXRP utility, Securd gives mXRP holders a safe borrowing venue.

Current status: Initial discussions. No signed agreement.

Target outcomes to negotiate:

- Midas surfaces Securd in its UX when users hold mXRP
- Joint educational content on using mXRP as collateral safely
- Co-announcement if and when agreement is formalized

Value to Midas: Every mXRP holder who uses Securd validates mXRP's utility beyond Midas's own ecosystem. A safe, conservative lending venue increases mXRP demand.

Realistic outcome: A technical acknowledgment and content collaboration is achievable without a formal agreement. Formal co-marketing requires more negotiation. Priority is getting Securd referenced in Midas's documentation and being visible to new minters.

Axelar Network — Infrastructure Partner

The relationship: Axelar bridges all non-native assets from the XRP Ledger to Securd's protocol layer. The LP token ITS registration is a joint technical achievement — the first time XRPL native AMM LP tokens are bridgeable cross-chain.

Current status: Discussions initiated. LP ITS registration is independently in progress on Axelar's side — Securd benefits from this regardless of formal partnership status.

Target outcomes:

- Written confirmation of LP ITS registration timeline before Securd's launch announcement
- Securd listed in Axelar's official ecosystem directory
- Joint announcement when LP ITS registration is confirmed complete
- Axelar ecosystem fund contribution to USDC/WETH seeding (\$50K-\$100K target)

Value to Axelar: Every Securd transaction is Axelar bridge volume. LP token collateral on Securd is a compelling demonstration of Axelar ITS capabilities on the XRP Ledger.

Important constraint: Axelar's LP ITS timeline is driven by Axelar's engineering roadmap. The Securd launch plan must not assume LP markets are available on Day 1. If ITS is not confirmed, LP markets launch as "coming soon — pending Axelar ITS confirmation."

Xaman Wallet — Distribution Partner

The relationship: Xaman (formerly XUMM) is the dominant XRPL Ledger wallet. Securd must be accessible from Xaman from Day 1 — it is the primary user acquisition channel, not a nice-to-have.

Target commitments:

- Securd listed in Xaman's dApp browser on launch day
- "Supply XRP" and "Borrow USDC" shortcuts in Xaman's DeFi section
- Xaman sends push notification to DeFi-active users on launch day

Value to Xaman: Securd brings the most-requested DeFi primitive (lending) to Xaman's user base, increasing wallet stickiness and transaction volume.

Timeline: dApp submission submitted 5 weeks before launch (2–3 week approval process).

Ripple — Strategic Backer

The relationship: Ripple is the most powerful entity in the XRP Ledger ecosystem. Their RLUSD stablecoin is the highest-quality asset in the ecosystem. Their XRPL Ecosystem Fund provides grants to projects building on XRPL EVM and the XRP Ledger.

Current status: Initial contact. No meeting confirmed. No commitment.

Realistic assessment: Ripple's involvement should be treated as an upside scenario, not a baseline assumption. Building the launch plan around Ripple liquidity creates fragility. The more realistic near-term outcome is a grant application being reviewed. Direct liquidity from Ripple is possible but should be modeled as a stretch goal only.

Staged target outcomes:

- Stage 1 (before launch): Grant application submitted to XRPL Ecosystem Fund; meeting secured
- Stage 2 (Month 1–2): Grant approval, \$50K–\$200K XRP for LIP
- Stage 3 (Month 3+): Ripple co-marketing of RLUSD market if and when bridge is confirmed
- Stage 4 (aspirational): Direct liquidity seed for RLUSD market at scale

Do not announce Ripple as a partner until Stage 2 is confirmed. Any premature claim damages credibility with both the community and with Ripple.

XRPL Foundation — Grant and Ecosystem

Target outcomes:

- XRPL Foundation grant: \$100K–\$200K for liquidity incentive program
- XRPL Foundation publishes Securd as a featured protocol
- XRPL Foundation co-presents Securd at community events

Value to XRPL Foundation: Securd is direct evidence that the XRPL Ledger can support sophisticated DeFi — their core mission.

Circle — USDC Seeding

Circle operates an active program for seeding USDC on new chains and protocols. XRPL EVM currently has only \$4,153 USDC — Circle's involvement can accelerate this by 50–100×.

Target: \$200K USDC seeded via Circle's ecosystem program.

Squid Router — Cross-Chain Acquisition

Squid Router enables one-click bridging from any EVM chain to XRPL EVM. A "Bridge and Supply" integration means any Ethereum or Polygon user can supply USDC or WETH to Securd in a single transaction.

Target: Live integration by Month 2. Estimated 100–200 new depositors/month from cross-chain flows.

Partnership Announcement Calendar

Week	Announcement	Amplification
-2 (reveal)	Securd + Midas Finance	Midas social
-2 (reveal)	Securd + Axelar	Axelar social
-1	Xaman dApp listing confirmed	Xaman social
0 (launch)	XRPL Foundation welcome	Foundation social
2	Ripple ecosystem acknowledgment	Ripple social (if confirmed)
3	Circle USDC partnership	Securd + Circle
5	Squid Router integration	Squid + Securd
6	DefiLlama top XRPL TVL milestone	Community announcement

8. Liquidity Provider Strategy

Target Launch TVL: \$2M (Conservative), \$4M (Optimistic)

Projections are revised to reflect realistic partnership status and competitive mXRP market. LP token markets are conditional on Axelar ITS confirmation.

Market	Conservative	Optimistic	Primary source
XRP	\$1.0M	\$1.8M	XRPL community + protocol-owned + XRPL Foundation grant
USDC	\$200K	\$500K	Cross-chain users + Circle grant + protocol-owned
mXRP	\$200K	\$500K	New mXRP minters + safety-conscious holders (competitive market)
XRP/RLUSD LP	\$250K	\$700K	LP holder campaign (conditional on Axelar ITS)
WETH	\$100K	\$200K	Cross-chain users via Squid
USDT	\$100K	\$200K	Market makers
XRP/USDC LP	\$75K	\$200K	LP holder campaign (conditional on Axelar ITS)
WBTC	\$75K	\$100K	BTC holders on XRPL
XRP/ARMY LP	\$0	\$50K	ARMY community (conditional on Axelar ITS + ARMY price feed)
Total	\$2.0M	\$4.25M	

mXRP TVL is deliberately conservative. A significant portion of existing mXRP liquidity is already engaged with another lending protocol. Securd's addressable mXRP market at launch is primarily new minters and safety-conscious holders — a real but limited pool.

Protocol-Owned Liquidity (Mandatory)

Securd Labs seeds each market before Day 1 to eliminate exchange rate manipulation risk on empty pools:

Market	Seed amount	Purpose
XRP	200,000 XRP (\$278K)	Market anchor, deep enough to borrow against
USDC	\$10,000	Meets minimum activation threshold
USDT	\$10,000	Meets minimum activation threshold
WETH	1 WETH (\$2,127)	Meets minimum activation threshold
WBTC	0.1 WBTC (\$10,500)	Meets minimum activation threshold

Institutional LP Program

30 days before launch, Securd reaches out privately to:

1. **Top 20 XRP holders on XRPL Ledger** — on-chain data is public, addresses can be associated with known entities
2. **Top 20 mXRP holders on XRPL Ledger** — direct targets for mXRP supply market
3. **Top 50 XRP/RLUSD LP holders** — direct targets for LP collateral market
4. **Asian crypto market makers** active in the XRP ecosystem

Offer: Early access, guaranteed allocation within supply caps, and direct communication with the founding team.

9. Marketing Strategy

Brand Pillars

Securd's marketing is built on three pillars that all content must reinforce:

Pillar	Message	Proof point
Native	Built for XRP Ledger users — no EVM required	Xaman integration on Day 1
Secure	Best-in-class risk architecture on XRPL	Published audit + risk parameters
Unlocking	Your assets should work for you, not sit idle	LP token collateral — unique feature

Three Core User Stories

All marketing content is anchored to one of three user stories. The protocol does not lead with technical features — it leads with human outcomes.

Story 1 — The XRP Holder

"I have 100,000 XRP. I believe in XRP. But I need \$20,000 for an opportunity today.
Securd: I tap 'Supply XRP' in Xaman. I tap 'Borrow USDC.' Done — 30 seconds.
I keep my XRP. I get my capital. I don't sell. I don't miss the next move."

Story 2 — The LP Provider

"I provide liquidity in the XRP/RLUSD pool. My LP earns 2.9% from trading fees.
Securd: same LP tokens, deposited as collateral. I borrow XRP against them.
Two income streams from one position. No protocol offered this before."

Story 3 — The mXRP Holder

"mXRP earns me Midas yield automatically. But my capital isn't doing anything else.
Securd: deposit mXRP, borrow USDC or XRP.
Midas yield plus borrowing capacity. Maximum efficiency on a single position."

Channel Strategy

Channel	Role	Frequency	Tone
Twitter/X	Primary distribution — metrics, announcements, education	3-4 posts/day	Clear, confident, data-driven
Discord	Community hub — support, discussion, governance signal	Always-on	Responsive, transparent, technical
Telegram	XRPL community reach — where XRPL users already are	Daily + alerts	Accessible, friendly
YouTube	Tutorials, AMAs, product demos	2×/week at launch	Educational, step-by-step
Blog / Mirror	Long-form — protocol health, transparency, education	Weekly	Authoritative, thorough
GitHub	Code, audits, technical documentation	As updated	Technical, precise

Content Plan — 90 Days

Pre-launch (Week -2 to Week -1):

- Protocol reveal thread
- LP token collateral explainer (graphics)
- mXRP + Securd use case
- "Why XRP Ledger needs a money market" — educational
- Tutorial videos: supply, borrow, repay
- Partnership reveals (Midas, Axelar, Xaman)

Launch week:

- Live metrics thread: TVL milestone updates every 2 hours
- "First 100 depositors" community recognition

- Daily tutorial: Day 1 XRP supply, Day 2 USDC borrow, Day 3 LP collateral, Day 4 health factor, Day 5 repay and withdraw

Month 1:

- "Securd Weekly" metrics report every Monday
- One partner spotlight per week (staggered announcements)
- First transparency report: oracle readings, liquidation events, bad debt = \$0

Month 2-3:

- LP token campaign content: "Your LP Earns Twice"
- mXRP × Securd deep-dive series
- "XRPL DeFi State" analysis — position Securd as ecosystem thought leader
- First user milestone celebrations (100 borrowers, \$1M borrowed, etc.)

KOL and Influencer Strategy

Target profile: XRPL-native accounts with genuine, engaged audiences — not generic crypto influencers.

Tier	Follower range	Count	Offer
Technical KOLs	10K-100K	3-5	Early access + technical briefing + usage incentive
Community voices	2K-15K	8-10	Early access + referral program
Media writers	Any	3-5	Exclusive story access — "LP token collateral on XRPL — a first"

Key message to KOLs: Securd has a genuine technical first (LP token collateral). Write about the feature, not the protocol — give them a real story to tell.

Avoid: Paid promotions from non-XRPL influencers. The XRPL community is experienced and immediately identifies inauthentic promotion. A single bad KOL choice is harder to recover from than no promotion at all.

PR Strategy

Target outlets:

- Decrypt, The Block, CoinDesk: Pitch "First LP token collateral on XRP Ledger"
- XRPL ecosystem newsletters (XRPScan, XRPL.to, Bithomp)
- Crypto Twitter threads by respected researchers

Pitch angle: Lead with the LP token collateral feature — this is novel and documentable. "For the first time on the XRP Ledger, holders of XRP/RLUSD AMM LP tokens can use them as collateral to borrow against. Here's why it matters and how it works."

Timing: Embargo lifts simultaneously with the launch tweet. Journalists publish their pieces within the first 24 hours.

Bug Bounty Program

Launching a bug bounty on Day 1 alongside the security audit serves dual purposes: it genuinely improves protocol security and it is a strong marketing signal of technical confidence.

Severity	Reward
Critical vulnerability	\$50,000 equivalent in XRP
High severity	\$10,000
Medium severity	\$2,500
Low severity	\$500

Publicize the bug bounty program in every developer-facing channel. The white-hat security community becomes a free extension of the security team.

10. Community Building

Discord Architecture

□ announcements	Read only – protocol updates, partnerships
□ metrics	Live TVL, rates, health data feeds
□ general	Open community discussion
□ strategies	Yield strategies, rate watching, market analysis
□ support	User help – moderated 24/7 at launch
□ bug-reports	Structured bug submission
□ developers	Liquidation bots, integrations, API documentation
□ governance	Protocol parameter discussions (preparatory)
□ incentives	LIP updates, Genesis Supplier tracking

Moderation: 3 full-time moderators at launch (covering UTC, US, and Asia time zones). Every support question answered within 2 hours in the first 30 days.

Discord growth targets:

- Phase 0: 500 members (alpha testers + early community)
- Day 1: 2,000 members
- Month 1: 4,000 members
- Month 3: 8,000 members

Telegram

Maintain two Telegram presences:

- 1. **Announcement channel** (read-only) — same content as Twitter, optimized for Telegram
- 2. **Community chat** — active, moderated discussion for XRPL Telegram users

Transparency as Community Bond

The strongest community-building tool is radical transparency:

- Publish every oracle circuit breaker event publicly within 24 hours
- Publish every liquidation event (asset, amount, health factor) in real time
- Publish monthly protocol health report: TVL, bad debt (target: \$0), revenue, reserve fund balance
- Publish quarterly risk parameter reviews with reasoning

Communities that trust a protocol's transparency stay through volatility. Communities built on hype leave at the first incident.

11. Key Metrics Dashboard

Protocol Health

KPI	Week 1	Month 1	Month 3	Month 6
Total TVL	\$1M	\$3M	\$5M	\$10M
Total borrowed	\$250K	\$1.2M	\$3M	\$7M
Unique depositors	100	400	800	2,000
Unique borrowers	40	150	400	1,000
Active markets	9	9	9-10	10-12
Bad debt ratio	0%	0%	<0.3%	<0.5%
Oracle incidents	0	0	0	0
Monthly protocol revenue	\$2K	\$8K	\$30K	\$100K

Community Health

KPI	Week 1	Month 1	Month 3
Twitter/X followers	3,000	8,000	20,000
Discord members	2,000	4,000	8,000
Telegram members	1,000	2,500	6,000
Tutorial video views	5,000	25,000	100,000
Media mentions	5	15	40

Partnership Scorecard

Partner	Launch status	Month 3 target
Midas Finance	☐ Signed + live	1,200 mXRP holders onboarded
Axelar	☐ LP ITS confirmed	Bridge-and-supply flow live
Xaman	☐ dApp listed	600 Xaman-sourced users
XRPL Foundation	Grant submitted	Grant received
Ripple	In discussion	LOI signed
Circle	Applied	\$200K USDC seeded
Squid Router	Month 2 target	Bridge-and-supply integration live
DefiLlama	☐ Day 1	Top 3 XRPL TVL ranking

12. Securd Points Program — Path to the Governance Token

Overview

The Securd Points Program is the bridge between early protocol usage and the future SECURD governance token. Points are earned by every user who interacts with the protocol — supplying, borrowing, maintaining positions, and participating in the community. When the SECURD governance token launches, accumulated points convert to tokens at a defined rate, rewarding the users who took early risk and built the protocol's liquidity foundation.

Points are a deliberate design choice over an immediate token launch. An immediate token creates governance complexity and regulatory questions at a stage when the protocol should be fo-

cused entirely on product-market fit. Points delay those questions while still incentivizing the behaviours the protocol needs — supply depth, borrow demand, and retention.

How Points Are Earned

Every action in the protocol generates points. The rate structure is designed to reward behaviours that create real protocol value: sustained supply (not just first deposit), active borrowing (not just deposits), and use of Securd's unique features (LP token collateral).

Supply Points

Asset type	Points per \$1 supplied per day
Stablecoins (USDC, USDT)	1.0 point
XRP	1.2 points (higher — native chain asset, core market)
WETH, WBTC	1.0 point
mXRP	1.5 points (higher — encourages collateral-only market growth)
XRP/RLUSD LP	2.0 points (premium — unique feature, hardest to replicate)
XRP/USDC LP	2.0 points
XRP/ARMY LP	1.8 points

Borrow Points

Active borrowers generate 0.5 points per \$1 borrowed per day. Borrowing creates protocol revenue and validates product-market fit — it should be incentivized alongside supply.

Loyalty Multipliers

The multiplier system ensures that capital which stays earns significantly more than capital that arrives and leaves.

Consecutive days in protocol	Supply point multiplier
0-14 days	1.0×
15-30 days	1.2×
31-60 days	1.5×
61-90 days	2.0×
91+ days	2.5× — Genesis Supplier status

A user who supplies \$10,000 USDC for 90+ days earns 2.5× the points of a user who supplies the same amount and withdraws after 2 weeks. This is the mechanism that creates sticky capital and defeats mercenary farming.

Referral Points

Users who refer new depositors earn 10% of the referred user's daily supply points for the first 30 days of the referred user's activity. This is a bounded referral mechanism — not a pyramid, as it only runs for 30 days per referral and does not compound.

Community Points

Non-financial contributions also generate points:

- Bug report accepted: 500 points (low severity) to 50,000 points (critical)
- Tutorial published and shared: 200 points (reviewed by team)
- Discord helper (100+ answered questions, verified): 50 points/day

Points Dashboard

Every user sees their real-time points balance, breakdown by source, and estimated token allocation based on total points distributed to date. Transparency is critical: if users cannot verify their position, they will not trust the conversion.

The dashboard displays:

- Total points earned (all-time)
- Points by source (supply, borrow, LP collateral, referral, community)
- Current loyalty multiplier and days-to-next-tier
- Estimated % of total protocol points (based on current distribution)
- Countdown to token conversion date

Point Seasons

The program runs in 90-day seasons. At the end of each season, a snapshot is taken of all accumulated points. This creates periodic cycles of urgency and recognition:

- **Season 1 (Day 1 to Day 90):** Genesis Season — highest multipliers, largest share of future token allocation per point. Users in Season 1 earn the most.
- **Season 2-4:** Ongoing, with slightly lower per-point token allocation as total point supply grows with the user base.
- **Conversion:** When the governance token launches (planned Month 9–10), a final snapshot is taken. All accumulated points across all seasons convert to SECURD tokens.

Points-to-Token Conversion

When SECURD token launches:

1. A fixed percentage of the total token supply is reserved for the Points Program (recommended: 40%).
2. The total number of points accumulated across all users and all seasons is calculated.
3. Each user's token allocation = (user's total points / total protocol points) × 40% of token supply.
4. Tokens vest over 6 months from conversion date — 1/6 per month — to prevent immediate sell pressure.

Example:

- Total SECURD supply: 100,000,000 tokens
- Points allocation: 40,000,000 tokens (40%)
- User has accumulated 500,000 points out of 50,000,000 total protocol points
- User's allocation: $(500,000 / 50,000,000) \times 40,000,000 = \mathbf{400,000 \text{ SECURD tokens}}$
- Vesting: 66,667 tokens per month over 6 months

Why This Structure Works

For users: Clear, verifiable path from today's supply deposit to future token ownership. No uncertainty about whether past activity will be rewarded.

For the protocol: Sustained, deep liquidity driven by the multiplier structure. Borrowing demand validated before the token launch (the protocol has real usage, not just TVL farming). When the token launches, it is backed by genuine protocol metrics.

For the token: A token launched after 9+ months of operation, with \$5–10M TVL, 1,000+ active borrowers, and a documented security record, starts from a position of credibility that a Day-1 token cannot have.

Anti-gaming measures:

- Minimum 7-day supply position to earn any supply points (prevents flash deposits)
 - Borrow points require a collateral health factor above 1.2 (no points for positions in liquidation risk)
 - Points are non-transferable between wallets
 - Sybil detection: multiple wallets with identical deposit patterns are flagged and reviewed
-

13. Revenue Model

Protocol Revenue Projection

Quarter	Average TVL	Utilization	Average borrow rate	Reserve Factor	Monthly Revenue
Q3 2026 (launch)	\$2M	40%	5.5%	20%	\$7,333
Q4 2026	\$5M	48%	6.0%	20%	\$24,000
Q1 2027	\$8M	52%	6.5%	20%	\$45,067
Q2 2027	\$12M	56%	7.0%	20%	\$78,400

Revenue formula: $\text{TVL} \times \text{utilization} \times \text{borrow_rate} \times \text{reserve_factor}$

Insurance Reserve Build

- Month 3: ~\$50K accumulated
- Month 6: ~\$150K accumulated → approaching 3% of \$5M TVL target
- Month 12: ~\$500K accumulated → exceeds 3% of \$10M TVL target □

Path to Governance Token

A future SECURD governance token introduces an additional TVL growth mechanism:

- Token emissions to early suppliers attract new capital (reflexive loop)
- Retroactive airdrop to first-90-day users rewards the community that took early risk
- Governance function: community votes on new asset listings, parameter changes, treasury allocation

Proposed distribution:

- 40% retroactive airdrop to early users (suppliers + borrowers, proportional to activity)
- 20% to sustained liquidity providers (90-day vesting)
- 15% team (3-year vesting, 1-year cliff)
- 15% ecosystem fund (grants, integrations, bug bounties)
- 10% protocol reserve

14. Risk Factors and Contingency Plans

Risk	Probability	Contingency
Low launch TVL (<\$500K on Day 1)	Medium	Activate institutional LP commitments; double POL seed; push Midas partnership harder
Axelar LP ITS registration delayed	Low	Launch with single assets; LP markets follow as planned once confirmed
RLUSD bridge remains unconfirmed	High (ongoing)	XRP/RLUSD LP market maintains RLUSD pool exposure; no action needed
Oracle manipulation attempt	Low	TWAP + circuit breakers + multi-source architecture makes this prohibitively expensive
Axelar bridge incident	Very Low	Circuit breakers pause affected markets; insurance reserve absorbs losses; transparent communication
XRP price crash at launch	Medium	Conservative CFs ensure solvency; liquidation bot protects protocol; transparent health reporting
LIP attracts only mercenary capital	Medium	90-day vesting on incentives + Genesis Supplier badge for sustained positions mitigates this
Xaman integration delay	Low	Pre-submitted 5 weeks early; Crossmark as backup on Day 1
Community backlash	Low	Audit published Day 1; all parameters public; all incidents disclosed within 24 hours
